PÁRAMO CCG

THE COLLECTIBLE CARD GAME

OFFICIAL RULEBOOK

INDEX

1. FUNDAMENTAL CONCEPTS AND VICTORY CONDITIONS
2. PLAY ZONES
3. CARD ANATOMY AND TYPES
4. THE RESOURCE SYSTEM
5. INITIATIVE SYSTEM AND THE STACK
6. COMPLETE TURN STRUCTURE
ANNEX A: BASIC CORE ABILITIES
ANNEX B: ORGANISM TYPES AND STRATEGIES

1. FUNDAMENTAL CONCEPTS

1.1. The Players

A duel of Páramo CCG faces two players. Each of them begins the game with 20 life points and each draws 5 cards from their properly shuffled deck.

The player who starts the game will be decided randomly.

A player immediately loses the game if their life points are reduced to 0 or less at any time, or if they must draw a card from their main deck and it is completely empty.

1.2. Deck Structure and Construction

A legal Páramo CCG deck consists of exactly 51 cards divided into two zones:

- **Main deck:** 50 cards, not one more, not one less.
- **Boss zone** (1 card): Contains your main boss.

The word "deck" appearing in the text boxes of the cards always refers to the main deck. Before starting the game, each player must shuffle their deck.

Construction rules:

1. **Copy limit:** You may include a maximum of 3 copies of the same card in the main deck.
2. **Boss exception:** You may only include 1 copy of each boss within the main deck. The boss located in the boss zone cannot also be present within the 50 cards of the main deck.
3. **Enclave exception:** Your deck can only include 1 enclave in total among the 50 cards of the main deck.
4. **Clan identity:** All cards in the deck must belong to the same clan or be neutral. You cannot mix cards from different clans in the same deck. There are neutral bosses, meaning they do not belong to any clan. The main deck must be composed exclusively of cards from a single clan. However, neutral cards and bosses can be included in any deck, and you can even designate a neutral boss as your main boss.

1.3 Beginning of the Game

Each player places their main boss in their respective boss zone. Then, they shuffle their deck and draw a hand of 5 cards. They may perform a selective mulligan, meaning they are allowed to select which cards from their initial hand to return to the deck in order to, after a new randomization, draw that same number of cards again.

The starting player (decided randomly) will not draw a card in their first draw phase, while the second player, in addition to drawing their corresponding turn card, will obtain a resource card to compensate for the disadvantage. That card will be an action costing 0 that grants an additional resource until the end of the turn.

1.4 Game Formats and Ranking

There is the possibility to play a constructed format with the deck containing the cards you choose, and a draft format (limited), which will be random. The draft format works as follows: three 14-card booster packs are used per player. Each player opens a pack, selects two cards, and passes the remaining cards to the adjacent player, repeating this process until the cards are depleted, and doing the same with the remaining two packs. The first pack will be passed to the right until it is finished. The second pack to the left and the third to the right again. After the draft is finished, each player must choose the 3 clans that can be present in their deck, choose a boss, and a neutral enclave or one from those 3 clans. The deck in limited format must contain exactly 30 cards. Additionally, there is the possibility to select fewer than 30 cards for the limited format deck and choose the "Fill" option, which will complete up to 30 cards with tokens of the generic neutral card "Soldier", an organism with 1 power and defense.

There will be a qualifying ranking in the constructed format and another qualifying ranking in the limited format. These rankings will have different categories or steps. From lowest to highest, they are: quartz, topaz, emerald, ruby, and the highest rank, diamond. In turn, each of them will be divided into 10 steps. Every victory adds a step. Every defeat subtracts one. Upon reaching the tenth step, you will ascend to the next rank. Diamond has no steps.

In addition to the rank, Páramo CCG has other ranking systems, such as ELO and trophies. The ELO gained or lost by a player is a value calculated based on the difference in ELO of both players. The greater the difference, the greater the amount of points the lower ELO player can win, and the greater the amount of points the higher ELO player can lose, and vice versa. Players initially possess an ELO value equal to 1000. Depending on the game mode, the ELO put into play varies and depends on a k factor, whose values can be k=16, k=32, and k=64, which implies that with a victory and a large difference in points between both players, 15, 31, and 63 points could be won respectively.

Finally, there is one last classification criterion: trophies won. Whenever a player reaches the maximum possible victories in an event, they will obtain a trophy for that event.

There are multiple game modes and, with them, multiple rankings. The game modes are described below:

1. **Constructed**
    a. Friendly: Against a friend, an alliance mate, a random opponent, or a bot. None of these affect rank or ELO, nor do they grant trophies.
    b. Ranked: Against a random opponent. Affects rank and ELO with k=16.
    c. Daily Tournament: Against a random opponent participating in the daily tournament. The tournament ends when the player reaches 5 victories or 2 defeats. It can be played as many times as desired within its opening hours. Affects rank and ELO with k=32.
    d. Weekly Tournament: Against a random opponent participating in the weekly tournament. The tournament ends when the player reaches 4 victories or 1 defeat. It can be played as many times as desired within its opening hours. Affects rank and ELO with k=64.
2. **Limited**
    a. Ranked: Against a random opponent participating in ranked limited. The event ends when the player reaches 5 victories or 2 defeats with the deck they have created. It can be played as many times as desired, performing a new draft each time. Affects rank and ELO with k=32.

2. PLAY ZONES

The battlefield is divided into five zones for each player:

1. **Main deck:** Remains face down. Neither player can see or reorder its contents. Every time something is searched for in the deck, it must be shuffled immediately afterward.
2. **Boss zone:** A public zone where the main boss resides at the beginning of the game.
3. **Hand:** Cards hidden from the opponent. The maximum limit of cards in hand at the end of the turn is 7. If a player exceeds this limit at the end of the turn, they must discard cards until they have 7 left.
4. **Battlefield:** A public zone where cards collectively referred to as objects (organisms, transports, mods, enclaves, and bosses) coexist. Card texts always refer to things that are in

play, that is, on the battlefield. When an object leaves play and returns, it is a new object in every sense and will have lost all properties it had acquired when it was previously in play. When an object changes controller, it is removed from combat if it was in it, it gains summoning sickness if it affects it (which would be the case only for organisms), and it maintains all its properties; even if it was tapped, it changes controller while tapped.

5. **Pit:** A face-up public discard zone where destroyed, played (effects), or discarded cards go. All your cards that are discarded or destroyed go to your pit.

Controller and Owner

The player who started the game with a card in their deck is considered the owner of that card. If a card or token is created during the game, the owner is the player under whose control it was generated. This ownership never changes throughout the game, regardless of which zone the card goes to. When a card leaves the battlefield and goes to any other zone, it always returns to the original owner of that card. The player who has authority over a card is considered its controller. As a rule, the player who plays the card is its controller. The control of a card can change during the game. The controller is the one who makes decisions about the card, decides who it attacks, pays its costs if required, and receives its mechanical benefits or detriments.

3. CARD ANATOMY AND TYPES

Páramo CCG cards possess a series of characteristics and attributes that determine their functionality. In the upper right corner, we will find a number that determines the amount of resources we must consume to be able to play it. Cards with power and defense attributes will have them in the lower-left and lower-right corners, respectively. In addition, they will have their own illustration and other distinctive features.

All Páramo CCG cards are divided into two categories according to their permanence on the board: **objects** (once played, they are placed on the battlefield) and **effects** (they do not touch the battlefield. Once played and resolved, they go to the pit).

3.1. Objects

An object is any card that enters and remains on the battlefield after being played and resolved. All objects can be the target of effects or abilities that affect "objects". Only objects possessing the defense attribute can receive damage. The base power and defense value of any object that has power and defense is the one written on the card itself. Any numerical value below zero will be considered zero for all mechanical purposes.

- **Organisms:** Your main combat troops. They possess attributes of power (damage they inflict) and defense (damage they can tolerate before dying). When an organism takes lethal damage, or if it has zero or less defense, it dies; this is equivalent to saying they are destroyed. Furthermore, organisms are the only objects that suffer from summoning sickness: they cannot attack or use abilities that require tapping until the beginning of your next turn after having entered the battlefield under your control.

- **Transports:** Mechanical units with power and defense. They cannot attack or block if they are not crewed.
  - **Crew:** During your main phase, with an empty stack (we will discuss the stack and initiative later), you may tap one or more organisms under your control whose total power is equal to or greater than the crew cost of the transport. The minimum power to crew transports is 1.
  - Transports can only be crewed once per turn. Organisms can only crew a transport once per turn. An organism that has already crewed cannot do so again this turn.
  - Once crewed, the transport can attack and block until the beginning of your next turn. Neither the destruction of the transport affects the organisms that crewed it, nor vice versa. This holds true for any other effect or ability that may affect their respective states. The organisms that crewed them and the crewed transports are independent objects.
  - **Summoning sickness rule for transports:** Transports do not suffer from summoning sickness. They can attack the same turn they enter the battlefield, provided they are crewed, and activate their abilities that require tapping.
  - **Crew members with summoning sickness:** An organism that has just entered play and has summoning sickness can indeed be tapped to pay the cost of crewing a transport.
- **Mods (Modifiers):** Equipment or technology upgrades. To play them, you must pay their respective cost. Once on the battlefield, they can be attached to an object after paying their **attach cost**. The minimum attach cost is 0.
  - They are always an object on the battlefield, whether they are attached or not.
  - They can be attached during your main phase, with an empty stack, to a valid target by paying their attach cost. Mods can only be attached to objects that are legal targets. Each mod has a subtype indicating which type of objects they can be attached to. For example, a mod that can only be attached to organisms will have the type "Mod - Organism", while a mod that can be attached to any object will have the type "Mod - Object".
  - Mods can only be attached once per turn, and organisms and the rest of the objects can only be attached by mods once per turn. An organism that has already been attached to cannot be attached to again this turn. An object is considered attached when it has a mod attached to it.
  - You can pay the attach cost to transfer a mod directly from one object to another as long as it is valid. If the object to which a mod is attached leaves the battlefield, the mod remains on the battlefield, unattached.
  - If an object attached by a mod changes controller, the mod will not change controller and will automatically unattach from the object.
- **Bosses:** They are organisms, but they have some special characteristics.
  - **Unique bosses on board rule:** If at any point you control more than one boss with the same name on the battlefield, you must choose one and immediately send the other copies to the pit. Each player can have the same boss, but there cannot be more than one Boss with the same name under the control of the same player. Your opponent can control their own bosses, even if they have the same name as yours.

    - **Main boss mechanic:** You can play it from the boss zone by paying its cost. If the main boss leaves the battlefield for any reason, its owner will return it to the boss zone. Every time it returns to the boss zone, playing it will cost 2 more for each time it has returned to the boss zone.

- **Enclaves:** Represent tactical locations or structures.
    - **Unique enclave on board rule:** You can only have one enclave under your control on the battlefield. If at any time you control more than one enclave, you must put all but one into the pit. Nothing prevents both players from having an enclave with the same name in play.

Destruction of Objects

When an object on the battlefield is destroyed, it goes directly to the pit. This can happen due to an effect that indicates so, or because it has taken damage equal to or greater than its defense.

Sacrifices also send objects directly to the pit. A player cannot sacrifice objects at will unless an effect or ability instructs them to do so. They also cannot sacrifice objects they do not control. **Sacrificing is not considered destruction.**

Counters

Counters are modifiers placed on objects to provide attributes of all kinds. Modifications or references to an object's power and defense are usually symbolized by +/+ or -/-, always being the first value referring to power and the second to defense. Any object can have any type of counter, but it will only affect those that can have those properties or abilities. +1/+1 counters and -1/-1 counters cancel each other out and disappear.

If the object that has those counters leaves the battlefield to go anywhere, it loses those counters.

3.2. Effects (Temporary Cards)

They do not enter the battlefield. After resolving, they immediately go to the pit.

- **Deployments:** Complex tactics. They can only be played during your turn's main phase, when you have the initiative and the stack is empty.
- **Actions:** Quick response tactics. They can be played at any time (during your turn or the opponent's) as long as you have the initiative.

3.3. Abilities

Abilities are the special capacities or rules written on the cards that alter the game or allow specific plays to be made.

Activated Abilities

- **Use mechanic:** They require an explicit payment (such as paying resources, tapping an object, or discarding cards) to be activated.

- **Player control:** They are activated voluntarily when the player decides to pay their cost and has the initiative to do so.
- **Typical structure:** They are formatted as "Cost: Effect" (e.g., "Pay 1 resource: Draw a card").

Triggered Abilities

- **Use mechanic:** They occur automatically without the need to pay an additional cost, unless the text specifies otherwise.
- **Automatic trigger:** They activate on their own at the exact moment a specific event happens in the game.
- **Typical structure:** They use conditional keywords such as "When...", "Whenever..." or "At the beginning of...".

Key Differences

- **Trigger vs. Decision:** An activated ability relies entirely on your decision to pay a cost; a triggered ability goes off automatically when the game detects the required condition.
- **Entering the Stack:** Both go onto the stack and can be responded to by the opponent, but the triggered one is placed on the stack automatically when the player receives initiative.

Continuous Abilities

Continuous abilities are those written in an object's text box that confer special attributes altering game rules in specific ways. Momentum, Aerial, or Bunker are some examples (you can see them defined in Annex A). As mentioned previously, they can also be obtained through activated and triggered abilities, either temporarily or permanently, as would be the case with counters. It is possible for an organism to gain an ability it already possesses. Abilities are not cumulative unless specified otherwise. If an object acquires an ability it already has, this second instance will simply be redundant.

3.4. Playing Cards and Abilities

In order to play a card, all of its targets (if it has any) must be legal. Targets are chosen when the card or ability is played. Next, the cost of the card must be paid. You cannot pay costs with the opponent's resources, nor with the opponent's cards or objects; the costs of the cards you play must be paid with your own resources. Only if all targets fail (for example, because they no longer exist or stop being valid targets), does the card fail.

When the effects of a card or an ability disappear because their source is destroyed in the resolution process while the ability or card is on the stack, that does not make the effects or abilities on the stack disappear; they will continue to exist and will resolve normally.

When several abilities trigger at the same time, each player orders them as they wish on the stack. If abilities from both players trigger at the same time, the ones from the player whose turn it is (active player) go onto the stack first, and then the ones from the player whose turn it is not go onto the stack, so that, due to how the stack resolves, those of the player who is not on their turn resolve first (initiative and stack will be explored in depth later).

3.5. Rarity Grades and Collecting

To acquire new Páramo CCG cards, you will need to open booster packs. Booster packs contain random cards, with at least one unusual (or rarer) rarity card guaranteed. All Páramo CCG cards incorporate a visual indicator in their anatomy that determines their degree of rarity. Rarity determines the frequency with which a card appears inside expansion booster packs.

There are 5 rarity grades, listed from lowest to highest scarcity: Normal (black), Special (green), Unusual (yellow), Enclave (orange), and Boss (red).

4. THE RESOURCE SYSTEM

4.1. Types and Identity

There are 5 thematic resource denominations associated with each clan: Gas (Asphalt), Metal (Gunpowder), Jimsonweed (Shadow), Blood (Horde), and Aether (Abyss).

For mechanical purposes, all resources are technically identical and are treated interchangeably under the universal term "resource". Neutral cards consume the resource native to the faction they are being played with.

4.2. Automatic Growth and Scaling

At the beginning of each of your turns, your maximum resource capacity automatically increases by 1. Your entire resource pool is fully recharged to the value of your current maximum capacity.

5. INITIATIVE SYSTEM AND THE STACK

To regulate real-time interactive responses in an orderly manner, Páramo CCG uses the initiative mechanic and the concept of the stack (LIFO: Last in, first out).

5.1. Initiative Rules

1. At the beginning of the phases, automatically triggered abilities may go off. These abilities will be placed on the stack immediately the moment a player receives the initiative.
2. The player holding the initiative can play all the cards and abilities the game allows them at that moment, until they pass. These cards and abilities go onto the stack.
3. Next, the initiative is transferred to the opponent to give them the opportunity to respond. They can also play all the cards and abilities the game allows them at that moment, until they pass.
4. For the stack to begin resolving, or to advance from one turn phase to another, both players must pass the initiative consecutively.

5.2. Resolving the Stack and Unrealizable Effects

When both players pass the initiative consecutively without adding new cards or abilities:

1. The cards or abilities on the stack resolve one by one in the reverse order in which they were played (the last card or ability to enter the stack is the first to execute its effect). Once resolved, the cards go to the pit if they are actions or deployments, enter the battlefield if they are objects, or disappear in the case of abilities.
2. **Impossibility of Fulfillment:** If upon resolving a card or ability, it asks a player to perform an action they cannot carry out (for example, "upon entering play, discard a card" and the player's hand is empty), nothing happens; the achievable part of the effect is applied and the rest is simply ignored.
3. After the resolution of each individual card or ability within the stack, players again receive an initiative window to add new cards and abilities before resolving the next accumulated element.

6. COMPLETE TURN STRUCTURE

Each turn is divided into four successive and independent phases. **The player who is playing their turn is called the active player.**

PHASE 1: FORMATION

1. **Untap:** All tapped objects controlled by the active player are untapped (returned to a vertical position).
2. **Growth:** The active player's maximum resource capacity increases by 1, and the pool is recharged to the maximum.
3. **Draw:** The active player draws 1 card from the top of their deck.

> *Exception: The player who starts the game does not draw a card on the first turn of the duel.*

> *Second Player: The player going second does draw on their first turn* ***and receives a special 0-cost action card. Upon playing it, they obtain 1 extra resource for that turn.***

Then, the active player receives the initiative. They may play cards and abilities. Once they do so or decide not to, which we call passing the initiative, the other player will also receive the initiative, being able to play cards or abilities again. The process is repeated until both players decide not to play anything (pass).

In this phase, the active player can play the following cards in any order as many times as their available resources allow:

- Play organisms, transports, mods, enclaves, and bosses (with an empty stack).
- Play deployments (with an empty stack).

- Crew transports and attach mods (with an empty stack).
- Play actions and activate abilities (even if the stack is not empty).

In short, actions are the only cards that can be played outside the formation phase, on any turn, and even if the stack is not empty.

PHASE 2: ATTACK

The active player chooses which untapped organisms or crewed transports will participate in the offensive and taps them. Attacks are directed globally against the rival player's life (not against specific objects). Next, the active player receives the initiative to play actions or abilities.

An object is considered an attacker if it has attacked this turn and is in the attack or block phase.

PHASE 3: BLOCK

The defending player assigns their untapped organisms or crewed transports to intervene. Whether there are blocks or not, the active player then receives the initiative to play actions or abilities.

1. Blocking does not tap defending objects.
2. Each blocker can only block one attacker, which will be considered blocked even if one of them leaves combat before the damage phase.
3. Multiple blockers can coordinate to stop the same attacker (multi-blocking). All blockers will deal damage to the same attacker, but the attacker will be able to distribute its damage as it wishes among the blockers. How that damage is distributed will be decided in the next phase.
4. A blocked organism or transport will not deal damage to the defending player.

PHASE 4: DAMAGE

All combat damage is calculated simultaneously.

- **Unblocked object:** Inflicts its power as damage to the opponent's life.
- **Blocked object:** The attacker and blocker inflict mutual damage equal to their respective power values.
- **Object blocked by multiple blockers:** The attacking player freely chooses how to distribute and assign the total damage of its power among all the blockers.
- **Death of objects:** Any organism or transport that throughout the turn has received accumulated damage equal to or greater than its defense is destroyed and sent immediately to the pit.

> *If there are objects with the Reflexes ability in combat, Reflexes damage will occur before normal damage. Thus, if an object leaves the battlefield before dealing its normal damage, it simply will not deal it.*

Triggered abilities derived from damage resolution go to the stack, and the active player receives the initiative to play actions and abilities.

> *Definition of combat damage: Only damage inflicted automatically by attacking and blocking organisms or transports at the beginning of the damage phase based on their power value is exclusively considered combat damage. Any other damage inflicted by a card's text, even if resolved during the damage phase — is considered non-combat damage and will simply be called damage.*

Once both players pass priority, we reach the end of the damage phase, with the following process:

1. **Expiration:** All continuous or temporary effects that state "until the end of the turn" end. If this causes an ability to trigger, the active player receives the initiative to play cards and abilities, to which the opponent can respond, as usual, via the initiative system.
2. **Discard:** If the active player has more than 7 cards in hand, they discard the excess to the pit. If this causes an ability to trigger, the active player receives the initiative to play cards and abilities, to which the opponent can respond, as usual, via the initiative system.
3. **Damage Cleanup:** All accumulated damage on surviving objects is removed (they are fully healed).
4. The turn ends and officially passes to the other player.

ANNEX A: BASIC CORE ABILITIES

The different abilities that exist within this game, described below, will appear written in the objects' text boxes, although they can also be obtained through counters that symbolize that this object possesses said ability.

- **Momentum (Ímpetu):** The object possessing Momentum can attack and use abilities that require tapping on the same turn it enters the battlefield, even if it is an organism.
- **Overwhelm (Sobrepasar):** When an attacking object with Overwhelm deals enough damage to destroy all of its blockers, the excess damage can be assigned directly to the defending player's life points.
- **Aerial (Aéreo):** An object with the Aerial ability can only be blocked by other objects that also possess the Aerial ability.
- **Anti-air (Antiaéreo):** Objects with the Anti-air ability can block other objects with the Aerial ability, even if they do not have said ability themselves.
- **Reflexes (Reflejos):** An object with Reflexes inflicts its combat damage before (instead of simultaneously with) objects that do not have this ability. This can cause the object without Reflexes to be destroyed before even being able to deal its combat damage. If both objects have Reflexes, they will deal damage to each other simultaneously, but before the rest of the objects without Reflexes.
- **Camouflage (Camuflaje):** An object with Camouflage cannot be chosen as a target by the opponent, neither by cards nor by abilities.
- **Guardian (Guardián):** It does not tap when attacking.
- **Bunker (Búnker) - Gunpowder:** Reduces the **combat damage received** by 1 and can block objects with the Aerial ability. This ability is characteristic of the Gunpowder clan.
- **Vigor (Brío) - Asphalt:** It is a property possessed by some objects of the Asphalt clan. It means "Whenever it attacks". It will always be accompanied, in the card's text box, by a triggered ability whose effect can range from increasing attack or defense to drawing a card. Example: "Whenever it attacks, it deals 1 damage to target organism controlled by an opponent."
- **Drain (Drenar) - Shadow:** You gain X life and the target, if it is an opponent, loses it. If it is an object, it receives X damage. We will usually find this ability on cards from the Shadow clan.
- **Immolate (Inmolar) - Horde:** Immolate X indicates the number of life points to pay (X) when triggering or activating an ability with Immolate. It will yield certain benefits that will be described in the text boxes of the cards with the Immolate ability. It is a typical ability of the Horde clan.
- **Weaken (Debilitar) - Abyss:** The target organism gets the amount of -1/-1 counters indicated in the ability. The quintessential ability of the Abyss clan.

ANNEX B: ORGANISM TYPES AND STRATEGIES

Distribution table of the clans, their main strategies, and their representative organism types:

CLAN	MAIN STRATEGIES	ORGANISM TYPES
Asphalt	Vigor, **transports**, discard (self)	Pilot, healer, looter, marksman, mechanic
Gunpowder	Bunker, **enclaves**, sacrifice	Mechanic, sentinel, gunner, advisor, engineer
Shadow	Drain, reanimate, aerial	Engineer, shaman, warlock, sorcerer, ritualist
Horde	Immolate, momentum, **mods**	Orc, goblin, troll, beast, giant
Abyss	Weaken, discard (opponent), steal objects	Deep one, ghoul, shoggoth, ancient one, mi-go
Neutrals	(Flexible support for any strategy)	Mercenary, berserker, animal, undead, fantasy, outer god
